

22/6/26

Weekly Test #3

1. Levels of Testing:

→ Unit Testing

- Done by the developers
- Also known as white box testing and glass box testing
- developer will test the unit of the code
- to catch the bug earlier
- to check the logic of the code.

→ Integration Testing

- Done by the tester
- Also known as API testing
- Check the data flow from one unit of code to another unit of code.

→ System Testing

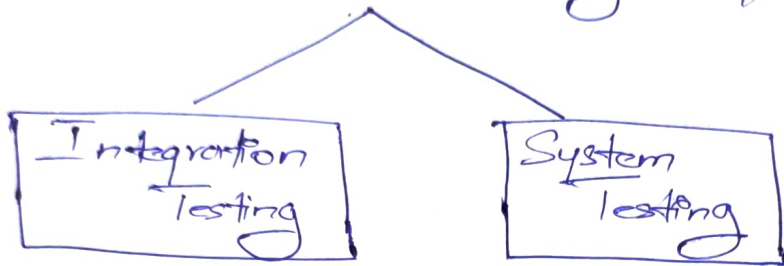

- Done by the testers
- To verify that the complete system meets the requirement

→ User-Acceptance Testing (UAT)

- Done by the End-users and Clients
- To validate that the software is ready for the deployment.

2. Functional Testing:

- it tests the functional requirements and specification of the software.
- it focus on finding bugs.

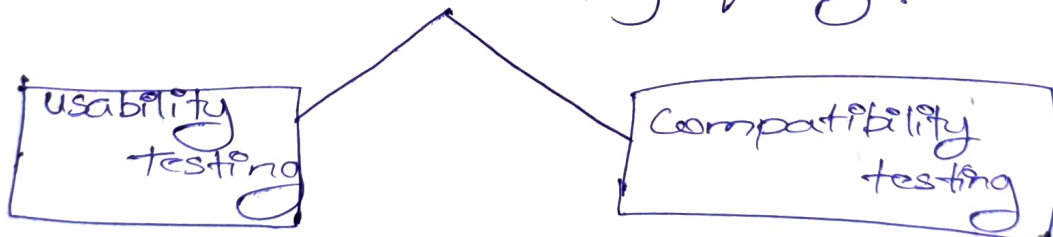

- Verifying the integration and data flow between components

- testing the entire integrated system
- ensure that it perform in a real-world.

Non-Functional Testing:

- Verify the non-functional requirement of the application.
- it focus on verifying quality.

- checking whether the page is navigate to the correct page

- Checking whether the application is used in different platform.
